

Abstract

Introduction and Objectives: good governance is a concept that developed in the late 1990s brought the development literature as the key to the puzzle. In fact, the quantity has replaced quality of government intervention. World Bank good governance based on six indicators commenting right and accountability, political stability, government effectiveness, quality of regulation, rule of law and control of corruption defined. However, the ultimate goal of human welfare.. The quality of government on health sector is very important.

Materials and Methods: In this study, using autoregressive pattern vector and vector error correction model has been studied relations between variables in the selected countries. The results of the model show that the health indicators of life expectancy at birth, infant mortality and access to safe water, with variable control of corruption, government efficiency and effectiveness, political stability, rule of law, the burden Financial Regulation, the quality of governance: voice and accountability and meaningful relationship.

Conclusions: H₀ a high level of development and living accommodations would not achieve unless they have experienced good governance or good governance.

Keywords: good governance, health, vector error correction model
